

FLUOROCARBON

Case study

Expansion Bearings

Product: Expansion joint bearings for a pedestrian bridge installed between existing buildings.

Our client wanted us to provide a solution that would allow movement at the connection point of existing building, and pedestrian bridge between two buildings.

Fluorocarbon provided an expansion bearing able to support light loads that could be installed into the existing building that was in the process of being constructed.

The expansion bearing pad could easily be installed into an existing building, our bearing materials combine low friction and minimal wear with a long service life and no maintenance making it a cost effective solution.
